

Installable

Basic mechanism for making software or software components installable.

How to use

- Clone the 'Installable' in the root of the project as the git submodule under the 'Installable' directory
- In the root of the project create a directory called 'Recipes'
- Optional: In the root of the project create the 'ABOUT.txt'
- Implement all the required 'recipes' under the 'Recipes' directory
- Execute: `bash Installable/install.sh` from the root of your project

Recipes

Some recipes are mandatory, some of them are not. The upcoming sections show mandatory and non-mandatory recipes and its explanations.

Mandatory recipes

- `prepare.sh`
- `install.sh`

Non-mandatory recipes

To be defined soon.
